

Customer - Concession: The relationship is such that each concession item can have many customers and each customer can have many items. Since we have many boxes of twizzlers, many people can buy them or no one can buy them.

Customer - Ticket: Each ticket can only have one and only customer. If there is no customer, there won't be a ticket created. A customer in our DB, however, does not need a ticket to exist, and they can also purchase multiple tickets.

Ticket - Movie: Each ticket can only refer to one movie, but each movie can sell multiple tickets.

Concession - Concession Inventory: Each concession item has one inventory, and each inventory entry only refers to one concession item.
